

Seekho Platform

Pakistan's Hyper-Local AI Curriculum Engine.

This platform saves hours of lesson planning for teachers.

Overview

Seekho Platform generates localized, PCTB-aligned lesson plans for Pakistani classrooms. It uses AI to create teacher guides, student handouts, and assessments. The content adapts to specific districts, local economies, and student demographics to fix passive learning and rote memorization.

Key Features

- **PCTB-Aligned Lessons:** Chapter-specific content mapped exactly to the PCTB syllabus.
- **Hyper-Local Examples:** Analogies use real places, occupations, and food from the selected district.
- **Active Learning Design:** Concept Ladders, Quick Think breaks, and structured AI Activities replace passive note-taking.
- **Download & WhatsApp:** Print-ready PDF, one-click DOCX downloads, and ready-to-send WhatsApp messages.

Tech Stack

- Python
- Streamlit (Frontend UI)
- Google Gemini API (AI Generation)
- Supabase (PostgreSQL Database)

Setup Instructions

1. Install Dependencies

Install the required Python packages.

```
pip install -r requirements.txt
```

2. Configure Environment Variables

Create a `.env` file in the root directory. Add your Supabase service credentials for database seeding.

```
SUPABASE_URL=your_supabase_url  
SUPABASE_SERVICE_KEY=your_service_role_key
```

3. Configure Streamlit Secrets

Create a `.streamlit` folder. Inside it, create a `secrets.toml` file. Add your active API keys.

```
GEMINI_API_KEY="your_gemini_key"  
SUPABASE_URL="your_supabase_url"  
SUPABASE_ANON_KEY="your_anon_key"
```

4. Seed the Database

Run the seed script exactly once. This populates your Supabase database with the complete PCTB syllabus and district data.

```
python seed_db.py
```

5. Run the Application

Start the Streamlit server.

```
streamlit run seekho_v3.py
```
